

## **FIXING INCOMPATIBLE APPLICATIONS USING A LIGHT DEBUGGER**

### Abstract of the Disclosure

5 A computer method for patching applications that are incompatible with an operating system is provided. The method determines if an application is compatible with an operating system, and if the application is determined to be incompatible, a debugger is loaded that runs the incompatible application. The debugger calls a handler to patch the incompatibilities of the application when a breakpoint has been reached in the incompatible application during the running of the incompatible application.
